

Topic 6: Circular motion and gravitation

See the [guide](#) for this topic.

6.1 – Circular motion

- **Period, frequency, angular displacement and angular velocity**

Uniform circular motion refers to circular motion at constant speed.

In a uniform circular motion, speed is constant while (angular) velocity and (angular) acceleration are constantly changing.

- While the magnitude of its velocity remains constant, the direction of its velocity is constantly changing.
- The acceleration causing this change in velocity is always directed towards the center of the circular path.

The period is the time taken for the object to complete one full circle and is usually calculated in seconds. The frequency can be calculated by $1/\text{period}$ and is usually measured in Hz.

- **Centripetal force**
