Physical Oceanography of the Baltic Sea Matti Leppäranta, Kai Myrberg, 2009-03-20 The Baltic Sea oceanographic research community is wide and the research history is over 100 years old Nevertheless there is still no single coherent book on the physical oceanography of the Baltic Sea as a whole There is a strong need for such a book coming from working oceanographers as well as the university teaching programmes in advanced undergraduate to graduate levels In the regional conference series in physical oceanography Baltic Sea Science Conference Baltic Sea Oceanographers conference Baltex conferences about 500 scientists take part regularly Even more scientists work in the fields of marine biology chemistry and the environment and they need information on the physics of the Baltic Sea as well There are nine countries bordering on the Baltic Sea and five more in the runoff area The Baltic Sea as a source of fish means of transportation and leisure activities is highly important to the regional society In the runoff area there are a total of 85 million people Research and protection strategies need to be developed as the Baltic Sea is probably the most polluted sea in the world Since the Baltic Sea has become an inner sea of the EU apart from small shore parts of Russia in Petersburg and Kaliningrad it is anticipated that the importance of the region will consequently rise The book will arouse interest among students scientists and decision makers involved with the Baltic problems It will also give important

background information for those working with biogeochemical processes in the Baltic Sea because the physical forcing for those processes is of vital importance *Elements of Marine Ecology* R V TAIT (DECD),FRANCES DIPPER,1998-02-12

Currents Through the Golden Gate Ernest Paul Petzrick,1993 From 9 November through 15 December 1992 a bottom mooring consisting of an upward looking acoustic doppler current profiler ADCP and a conductivity temperature pressure CTD instrument were deployed in the Golden Gate Tidal constituents were derived from

least squares fit on pressure and current data The amplitude of the M2 tide was 0.6 m and 100 cm/s and primary tidal constituents were about 0.3 m and 20 cm/s Current profiles were largely barotropic and one dimensional Overtides and compound tides had amplitudes less than 0.02 m and 5 cm/s but had baroclinic structure and two dimensional hodographs Tidal currents appear to be hydraulically driven Mean flow and transport were directed at 110 deg T at 23 cm/s and 45 cu m/s indicative of the two dimensional structure of the Golden Gate Mean energy fluxes at the site were 30 000 W for kinetic energy advection and 8 500 000 W for the work done by pressure If representative of the channel they imply a total energy flux of 8.5×10^9 W through the Gate
