Embedded Computing Joseph A. Fisher, Paolo Faraboschi, Cliff Young, 2005-01-19 The fact

that there are more embedded computers than general purpose computers and that we are impacted by hundreds of them every day is no longer news. What is news is that their increasing performance requirements, complexity, and capabilities demand a new approach to their design. Fisher, Faraboschi, and Young describe a new age of embedded computing design in which the processor is central, making the approach radically distinct from contemporary practices of embedded systems design. They demonstrate why it is essential to take a computing-centric and system design approach to the traditional elements of nonprogrammable components, peripherals, interconnects, and buses. These elements must be unified in a system design with high performance processor architectures, microarchitectures, and compilers, and with the compilation tools, debuggers, and simulators needed for application development. In this landmark text, the authors apply their expertise in highly interdisciplinary hardware, software development, and VLIW processors to illustrate this change in embedded computing. VLIW architectures have long been a popular choice in embedded systems design, and while VLIW is a running theme throughout the book, embedded computing is the core topic. *Embedded Computing* examines both in a book filled with fact and opinion, based on the authors' many years of R D experience. Complemented by a unique professional quality embedded tool chain on the authors' website (<http://www.vliw.org/book>). Combines technical depth with real world experience. Comprehensively explains the differences between general purpose computing systems and embedded systems at the hardware, software, tools, and operating system levels. Uses concrete examples to explain and motivate the trade offs.

Computer Architecture John L. Hennessy, David A. Patterson, 2017-11-23. *Computer Architecture: A Quantitative Approach*, Sixth Edition, has been considered essential reading by instructors, students, and practitioners of computer design for over 20 years. The sixth edition of this classic textbook from Hennessy and Patterson, winners of the 2017 ACM A M Turing Award recognizing contributions of lasting and major technical importance to the computing field, is fully revised with the latest developments in processor and system architecture. The text now features examples from the RISC-V RISC Five instruction set architecture, a modern RISC instruction set developed and designed to be a free and openly adoptable standard. It also includes a new chapter on domain-specific architectures and an updated chapter on warehouse-scale computing that features the first public information on Google's newest WSC. True to its original mission of demystifying computer architecture, this edition continues the longstanding tradition of focusing on areas where the most exciting computing innovation is happening while always keeping an emphasis on good engineering design. Winner of a 2019 Textbook Excellence Award (Texty) from the Textbook and Academic Authors Association. Includes a new chapter on domain-specific architectures explaining how they are the only path forward for improved performance and energy efficiency given the end of Moore's Law and Dennard scaling. Features the first publication of several DSAs from industry. Features extensive updates to the chapter on warehouse-scale computing with the first public information on the newest Google WSC. Offers updates to other chapters including new material dealing with the use of stacked DRAM, data on the performance of new NVIDIA Pascal GPU vs new AVX-512 Intel
