Before a program can be written, a programmer needs a clear problem , which includes a list of assumptions, a description of known information, and a specification for what constitutes a solution. Programming projects can be approached using a(n) methodology, which requires extensive planning and documentation up front. An alternative approach is to use the methodology in which programs are developed in iterations called . Those parameters may include that represent values that can change, or that represent unchanging values. All computer programs should include internal documentation in the form of , which are explanatory comments inserted into a computer program following language-specific symbols, such as # or keywords such as REM. A program is not complete until it has been tested to ensure that it contains no errors, logic errors, or runtime errors. Programmers can use methods based on rigorous logical and mathematical models to reduce the number of defects in a software product. Additional techniques for producing high-quality, secure programs include threat modeling and programming.
