
Design Compiler and the Design Flow

Figure 1-1 shows a simplified overview of how Design Compiler fits into the design flow.

Figure 1-1 Design Compiler and the Design Flow

You use Design Compiler for logic synthesis, which is the process of converting a design description written in a hardware description language such as Verilog or VHDL into an optimized gate-level netlist mapped to a specific technology library. The steps in the synthesis process are as follows:

1. The input design files for Design Compiler are often written using a hardware description language (HDL) such as Verilog or VHDL.

Design Compiler User Manual:

Design of Energy-Efficient Application-Specific Instruction Set Processors Tilman Glökler, Heinrich Meyr, 2007-05-08 After a brief introduction to low power VLSI design the design space of ASIP instruction set architectures ISAs is introduced with a special focus on important features for digital signal processing Based on the degrees of freedom offered by this design space a consistent ASIP design flow is proposed this design flow starts with a given application and uses incremental optimization of the ASIP hardware of ASIP coprocessors and of the ASIP software by using a top down approach and by applying application specific modifications on all levels of design hierarchy A broad range of real world signal processing applications serves as vehicle to illustrate each design decision and provides a hands on approach to ASIP design Finally two complete case studies demonstrate the feasibility and the efficiency of the proposed methodology and quantitatively evaluate the benefits of ASIPs in an industrial context Ultra-Low Energy Domain-Specific Instruction-Set Processors Francky Catthoor, Praveen Raghavan, Andy Lambrechts, Murali Jayapala, Angeliki Kritikakou, Javed Absar, 2010-08-05 Modern consumers carry many electronic devices like a mobile phone digital camera GPS PDA and an MP3 player The functionality of each of these devices has gone through an important evolution over recent years with a steep increase in both the number of features as in the quality of the services that they provide However providing the required compute power to support an uncompromised combination of all this functionality is highly non trivial Designing processors that meet the demanding requirements of future mobile devices requires the optimization of the embedded system in general and of the embedded processors in particular as they should strike the correct balance between flexibility energy efficiency and performance In general a designer will try to minimize the energy consumption as far as needed for a given performance with a sufficient flexibility However achieving this goal is already complex when looking at the processor in isolation but in reality the processor is a single component in a more complex system In order to design such complex system successfully critical decisions during the design of each individual component should take into account effect on the other parts with a clear goal to move to a global Pareto optimum in the complete multi dimensional exploration space In the complex global design of battery operated embedded systems the focus of Ultra Low Energy Domain Specific Instruction Set Processors is on the energy aware architecture exploration of domain specific instruction set processors and the co optimization of the datapath architecture foreground memory and instruction memory organisation with a link to the required mapping techniques or compiler steps at the early stages of the design By performing an extensive energy breakdown experiment for a complete embedded platform both energy and performance bottlenecks have been identified together with the important relations between the different components Based on this knowledge architecture extensions are proposed for all the bottlenecks *Integrated Circuit and System Design. Power and Timing Modeling, Optimization and Simulation* Vassilis Paliouras, Johan Vounckx, Diederik Verkest, 2005-08-25 Welcome to the proceedings of PATMOS 2005 the 15th in a series of

international workshops PATMOS2005 was organized by IMEC with technical co-sponsorship from the IEEE Circuits and Systems Society. Over the years PATMOS has evolved into an important European event where researchers from both industry and academia discuss and investigate the emerging challenges in future and contemporary applications design methodologies and tools required for the development of upcoming generations of integrated circuits and systems. The technical program of PATMOS 2005 contained state-of-the-art technical contributions, three invited talks, a special session on hearing aid design, and an embedded tutorial. The technical program focused on timing performance and power consumption as well as architectural aspects with particular emphasis on modeling, design characterization, analysis, and optimization in the nanometer era. The Technical Program Committee, with the assistance of additional expert reviewers, selected the 74 papers to be presented at PATMOS. The papers were divided into 11 technical sessions and 3 poster sessions. As is always the case with the PATMOS workshops, the review process was anonymous; full papers were required, and several reviews were carried out per paper. Beyond the presentations of the papers, the PATMOS technical program was enriched by a series of speeches offered by world-class experts on important emerging research issues of industrial relevance. Prof. Jan Rabaey (Berkeley, USA) gave a talk on "Traveling the Wild Frontier of Ultra-Low Power Design." Dr. Sung Bae Park (Sung) gave a presentation on "DVL: Deep Low Voltage Circuits and Devices." Prof. **Transaction-Level Power Modeling** (Amr Baher Darwish, Magdy Ali El-Moursy, Mohamed Amin Dessouky), 2019-08-01. This book describes for readers a methodology for dynamic power estimation using Transaction Level Modeling (TLM). The methodology exploits the existing tools for RTL simulation, design synthesis, and SystemC prototyping to provide fast and accurate power estimation using Transaction Level Power Modeling (TLPM). Readers will benefit from this innovative way of evaluating power on a high level of abstraction at an early stage of the product life cycle, decreasing the number of the expensive design iterations. *Reliable Software for Unreliable Hardware* (Semeen Rehman, Muhammad Shafique, Jörg Henkel), 2016-04-20. This book describes novel software concepts to increase reliability under user-defined constraints. The authors' approach bridges for the first time the reliability gap between hardware and software. Readers will learn how to achieve increased soft error resilience on unreliable hardware while exploiting the inherent error masking characteristics and error stemming from soft errors, aging, and process variations. **Introduction to Digital Signal Processing and Filter Design** (B. A. Shenoi), 2005-10-19. A practical and accessible guide to understanding digital signal processing. *Introduction to Digital Signal Processing and Filter Design* was developed and fine-tuned from the author's twenty-five years of experience teaching classes in digital signal processing. Following a step-by-step approach, students and professionals quickly master the fundamental concepts and applications of discrete-time signals and systems, as well as the synthesis of these systems to meet specifications in the time and frequency domains. Striking the right balance between mathematical derivations and theory, the book features Discrete-time signals and systems, Linear difference equations, Solutions by recursive algorithms, Convolution

Time and frequency domain analysis Discrete Fourier series Design of FIR and IIR filters Practical methods for hardware implementation A unique feature of this book is a complete chapter on the use of a MATLAB r tool known as the FDA Filter Design and Analysis tool to investigate the effect of finite word length and different formats of quantization different realization structures and different methods for filter design This chapter contains material of practical importance that is not found in many books used in academic courses It introduces students in digital signal processing to what they need to know to design digital systems using DSP chips currently available from industry With its unique classroom tested approach Introduction to Digital Signal Processing and Filter Design is the ideal text for students in electrical and electronic engineering computer science and applied mathematics and an accessible introduction or refresher for engineers and scientists in the field
