89. One of the examples in this chapter deals with the following impact problem, with the result that the ratio of forces is given by:

$$\frac{F_A}{F_B} = \frac{(\cos \theta_1 + \cos \theta_2)}{(\cos \theta_2 + \cos \theta_1)}$$

For an angle of $\theta_1 = 0$, produce a graph of the force ratio as a function of the angle θ_2 .

FIGURE P2.89

90. One of the examples in this chapter involved calculations made to determine the power output of a turbine in a dam (see Figure P2.90). When the flow through the turbine was 50,000 gpm, and the upstream height is 120 ft, the power was found to be 1427 hp. The relationship between the flow through the turbine and the upstream height is linear. Calculate the work done by (or power received from) the water as it flows through the dam for upstream heights that range from 60 to 120 ft.
