

If the engine is started when the selector lever is in any position but NEUTRAL, oil flows to both ends of the differential and safety valve spool (3). The spring forces both the spool spool to the left. In this position, the oil flow to the directional clutches is blocked and the machine will not move. When the selector lever is moved to the NEUTRAL position, the oil at the end of the differential and safety valve (3) is opened to drain. The oil pressure then maintains the spring force, the spool moves to the right and the controls are ready for a clutch fill and modulation cycle to occur as the selector lever is moved to a FORWARD position.

The fatigue strength (with safety factor R_f) limits the maximum pressure in the fatigue resistant (FR) to approximately 22.0 psi (1.5 kg/cm²).

Thermal expansion control of pressure is controlled by an orifice at the entrance to the oil column.

Thermometer lubrication oil pressure is limited to approximately 8 psi (0.6 kg/cm²) by the maximum lubrication oil relief valve (17).
