Comparison Theorems in Riemannian Geometry Jeff Cheeger, D. G. Ebin, 2008-04-08 The central theme of this book is the interaction between the curvature of a complete Riemannian manifold and its topology and global geometry The first five chapters are preparatory in nature They begin with a very concise introduction to Riemannian geometry followed by an exposition of Toponogov's theorem the first such treatment in a book in English Next comes a detailed presentation of homogeneous spaces in which the main goal is to find formulas for their curvature A quick chapter of Morse theory is followed by one on the injectivity radius Chapters 6-9 deal with many of the most relevant contributions to the subject in the years 1959 to 1974 These include the pinching or sphere theorem Berger's theorem for symmetric spaces the differentiable sphere theorem the structure of complete manifolds of non negative curvature and finally results about the structure of complete manifolds of non positive curvature Emphasis is given to the phenomenon of rigidity namely the fact that although the conclusions which hold under the assumption of some strict inequality on curvature can fail when the strict inequality is relaxed to a weak one the failure can happen only in a restricted way which can usually be classified up to isometry Much of the material particularly the last four chapters was essentially state of the art when the book first appeared in 1975 Since then the subject has exploded but the material covered in the book still represents an essential prerequisite for anyone who wants to work in the field

Liviu I Nicolaescu, 2020-10-08 The goal of this book is to introduce the reader to some of the main techniques ideas and concepts frequently used in modern geometry It starts from scratch and it covers basic topics such as differential and integral calculus on manifolds connections on vector bundles and their curvatures basic Riemannian geometry calculus of variations DeRham cohomology integral geometry tube and Crofton formulas characteristic classes elliptic equations on manifolds and Dirac operators The new edition contains a new chapter on spectral geometry presenting recent results which appear here for the first time in printed form **Introduction to Riemannian Manifolds** John M. Lee, 2019-01-02 This

textbook is designed for a one or two semester graduate course on Riemannian geometry for students who are familiar with topological and differentiable manifolds The second edition has been adapted expanded and aptly retitled from Lee's earlier book *Riemannian Manifolds An Introduction to Curvature* Numerous exercises and problem sets provide the student with opportunities to practice and develop skills appendices contain a brief review of essential background material While demonstrating the uses of most of the main technical tools needed for a careful study of Riemannian manifolds this text focuses on ensuring that the student develops an intimate acquaintance with the geometric meaning of curvature The reasonably broad coverage begins with a treatment of indispensable tools for working with Riemannian metrics such as connections and geodesics Several topics have been added including an expanded treatment of pseudo Riemannian metrics a more detailed treatment of homogeneous spaces and invariant metrics a completely revamped treatment of comparison theory based on Riccati equations and a handful of new local to global theorems to name just a few highlights Reviews of the first edition Arguments and proofs are written down precisely and clearly The expertise of the author is reflected in many valuable comments and remarks on the recent developments of the subjects Serious readers would have the challenges of solving the exercises and problems The book is probably one of the most easily accessible introductions to Riemannian geometry M C Leung MathReview The book's aim is to develop tools and intuition for studying the central unifying theme in Riemannian geometry which is the notion of curvature and its relation with topology The main ideas of the subject motivated

as in the original papers are introduced here in an intuitive and accessible way The book is an excellent introduction designed for a one semester graduate course containing exercises and problems which encourage students to practice working with the new notions and develop skills for later use By citing suitable references for detailed study the reader is stimulated to inquire into further research C L Bejan zBMATH *Geometry, Groups and Mathematical Philosophy* Krishnendu Gongopadhyay, Shashikant A. Katre, 2025-02-21 This volume contains the proceedings of the International Conference on Geometry Groups and Mathematical Philosophy held in honor of Ravindra S Kulkarni's 80th birthday Talks at the conference touched all the areas that intrigued Ravi Kulkarni over the years Accordingly the conference was divided into three parts differential geometry symmetries arising in geometric and general mathematics mathematical philosophy and Indian mathematics The volume also includes an expanded version of Kulkarni's lecture and a brief autobiography

Proceedings of the International Congress of Mathematicians Rajendra Bhatia, Arup Pal, 2010 ICM 2010 proceedings comprise a four volume set containing articles based on plenary lectures and invited section lectures the Abel and Noether lectures as well as contributions based on lectures delivered by the recipients of the Fields Medal the Nevanlinna and Chern Prizes The first volume will also contain the speeches at the opening and closing ceremonies and other highlights of the Congress **Classical and Discrete Differential Geometry** David Xianfeng Gu, Emil Saucan, 2023-01-31 This book introduces differential geometry and cutting edge findings from the discipline by incorporating both classical approaches and modern discrete differential geometry across all facets and applications including graphics and imaging physics and networks With curvature as the centerpiece the authors present the development of differential geometry from curves to surfaces thence to higher dimensional manifolds and from smooth structures to metric spaces weighted manifolds and complexes and to images meshes and networks The first part of the book is a differential geometric study of curves and surfaces in the Euclidean space enhanced while the second part deals with higher dimensional manifolds centering on curvature by exploring the various ways of extending it to higher dimensional objects and more general structures and how to return to lower dimensional constructs The third part focuses on computational algorithms in algebraic topology and conformal geometry applicable for surface parameterization shape registration and structured mesh generation The volume will be a useful reference for students of mathematics and computer science as well as researchers and engineering professionals who are interested in graphics and imaging complex networks differential geometry and curvature
