

Copula Modeling: An Introduction for Practitioners

Pravin K. Trivedi and David M. Zimmer

Copula Modeling explores the robust approach for econometric modeling of joint stochastic distributions. Copula Modeling demonstrates that practical implementation and estimation is relatively straightforward despite the complexity of its theoretical foundations. An attractive feature of parametrically specific copulas is that estimation and inference are based on standard maximum likelihood procedures. Thus, copulas can be estimated using standard econometric software. This offers a substantial advantage of copulas over recently proposed simulation-based approaches to joint modeling. Copulas are useful in a variety of modeling situations including financial markets, actuarial science, and macroeconomic modeling.

Copula Modeling provides practitioners and scholars with a useful guide to copula modeling with a focus on estimation and misspecification. The authors cover important theoretical foundations. Throughout, the authors use Monte Carlo experiments and simulations to demonstrate copula properties.

Dependence Modeling with Copulas Harry Joe, 2014-06-26 Dependence Modeling with Copulas covers the substantial advances that have taken place in the field during the last 15 years including vine copula modeling of high dimensional data Vine copula models are constructed from a sequence of bivariate copulas The book develops generalizations of vine copula models including common and structured factor models that extend from the Gaussian assumption to copulas It also discusses other multivariate constructions and parametric copula families that have different tail properties and presents extensive material on dependence and tail properties to assist in copula model selection The author shows how numerical methods and algorithms for inference and simulation are important in high dimensional copula applications He presents the algorithms as pseudocode illustrating their implementation for high dimensional copula models He also incorporates results to determine dependence and tail properties of multivariate distributions for future constructions of copula models

Extensions to Gaussian Copula Models Yan Fang, 2012 A copula is the representation of a multivariate distribution Copulas are used to model multivariate data in many

fields Recent developments include copula models for spatial data and for discrete marginals We will present a new methodological approach for modeling discrete spatial processes and for predicting the process at unobserved locations We employ Bayesian methodology for both estimation and prediction Comparisons between the new method and Generalized Additive Model GAM are done to test the performance of the prediction Although there exists a large variety of copula functions only a few are practically manageable and in certain problems one would like to choose the Gaussian copula to model the dependence Furthermore most copulas are exchangeable thus implying symmetric dependence However none of them is flexible enough to catch the tailed upper tailed or lower tailed distribution as well as elliptical distributions An elliptical copula is the copula corresponding to an elliptical distribution by Sklar's theorem so it can be used appropriately and effectively only to fit elliptical distributions While in reality data may be better described by a fat tailed or tailed copula than by an elliptical copula This dissertation proposes a novel pseudo copula the modified Gaussian pseudo copula based on the Gaussian copula to model dependencies in multivariate data Our modified Gaussian pseudo copula differs from the standard Gaussian copula in that it can model the tail dependence The modified Gaussian pseudo copula captures properties from both elliptical copulas and Archimedean copulas The modified Gaussian pseudo copula and its properties are described We focus on issues related to the dependence of extreme values We give our pseudo copula characteristics in the bivariate case which can be extended to multivariate cases easily The proposed pseudo copula is assessed by estimating the measure of association from two real data sets one from finance and one from insurance A simulation study is done to test the goodness of fit of this new model
