Transformer protection and control

ABB RET615 ANSI 5.0 (10)

RET615 is a member of ABB's Relion® product family and a part of its 615 protection and control product series. The 615 series relays are characterized by their compactness and withdrawable design. Engineered from the ground up, the 615 series has been designed to unleash the full potential of the IEC 61850 standard for communication and interoperability between substation automation devices.

Application

The RET615 is the ultimate protection and control relay for two-winding power transformers and power generator-transformer blocks. It can be applied for protection and control of the most commonly used power transformer combinations of delta and wye (grounded or ungrounded) windings. Flexible order coding allows for choosing current-only or current-and-voltage configurations to best fit your transformer application needs.

Protection and control

The RET615 features three-phase, multi-stage transformer differential protection with an unrestrained stage and a restrained stage to provide fast and selective protection for phase-to-phase, winding inter-turn and bushing flash-over faults. Besides second harmonic restraining an advanced waveform-based blocking algorithm ensures stability at transformer

The RET615 is a dedicated transformer protection and control IED for power transformers, unit and step-up transformers including power generator-transformer blocks in utility and industry power distribution systems.

energization and a fifth harmonic restraining function ensures good protection stability at moderate overexcitation of power transformers.

Sensitive restricted earth-fault protection (REF) completes the overall differential protection to detect even single phase-to-ground faults close to the grounded neutral of the transformer.

The low-impedance REF protection uses neither stabilizing resistors nor variators and allows the ratio of the grounded neutral CT to differ from the phase current transformer ratios. Because the REF protection characteristics do not need time grading with other protection schemes, high-speed fault clearance may be achieved. The RET615 also includes a thermal overload protection function, which supervises the thermal stress of the transformer windings to prevent accelerated aging of the insulations. Multiple stages of phase and ground overcurrents are provided for both transformer windings plus optional voltage inputs for metering and protection of one transformer winding or both windings. A fast three-channel arc-fault protection system for arc flash supervision of the switchgear compartments is offered.

RET615 also integrates basic control functionality, which facilitates the control of two circuit breakers
