Dremin, 2012-12-06 It is known that the Chapman Jouguet theory of detonation is based on the assumption of an

instantaneous and complete transformation of explosives into detonation products in the wave front Therefore one should not expect from the theory any interpretations of the detonation limits such as shock initiation of detonation and kinetic instability and propagation failure diameter The Zeldovich Von Neuman Doring ZND theory of detonation appeared in fact as a response to the need for a theory capable of interpreting such limits and the ZND detonation theory gave qualitative interpretations to the detonation limits These interpretations were based essentially on the theoretical notion that the mechanism of explosives transformation at detonation is a combustion of a layer of finite thickness of shock compressed explosive behind the wave shock front with the velocity of the front However some experimental findings turned out to be inconsistent with the theory A very small change of homogeneous liquid explosives detonation velocity with explosive charge diameter near the rather sizable failure diameter is one of the findings The elucidation of the nature of this finding has led to the discovery of a new phenomenon This phenomenon has come to be known as the breakdown BD of the explosive self ignition behind the front of shock waves under the effect of rarefaction waves

Chemical Reactivity Savaş Kaya, Laszlo von Szentpaly, Goncagul Serdaroglu, Lei Guo, 2023-05-15 The growth of technology for chemical assessment has led to great developments in the investigation of chemical reactivity in recent years but key information is often dispersed across many different research fields Combining both original principles and the cutting edge theories used in chemical reactivity analysis Chemical Reactivity Volume 1 present the latest developments in theoretical chemistry and its application for the assessment of chemical processes Beginning with an exploration of different theories and principles relating to electronic structure and reactivity of confined electronic systems the book goes on to highlight key information on such topics as Dyson orbitals target ion overlaps reaction fragility magnetizability principles and the Fukui function Density Functional Theory is discussed in relation to numerous different principles and approaches with further information on constrained methods and diabatic models bonding evolution theory orbital based population analysis models and charge transfer models and Quantum chemistry and QTAIM Consolidating the knowledge of a global team of experts in the field Chemical Reactivity Volume 1 Theories and Principles is a useful resource for both students and researchers interested in gaining greater understanding of the principles and theories underpinning chemical reactivity analysis Provides readers with the key information needed to gain a good overview of contemporary chemical reactivity studies and a clear understanding of the theory behind state of the art methods in the field Highlights advances in the computational descriptions of reactivity including reactivity in confined environments conceptual density functional theory and multi reference quantum chemistry Provides comprehensive coverage by consolidating the knowledge of many well known researchers in the field from around the world

Chemical Reactions Control Aiden Feynman, AI, 2025-02-18 Chemical Reactions Control explores the science and art of manipulating chemical reactions a crucial skill for optimizing industrial outputs minimizing waste and driving innovation The book focuses on mastering key variables like temperature catalysts and pressure to enhance chemical processes Did you know that

understanding chemical kinetics and thermodynamics is vital for bridging the gap between lab research and large scale production Mastering reaction parameters allows for economically viable and environmentally responsible chemical manufacturing This book begins with the fundamentals of chemical kinetics and thermodynamics before diving into the three primary control factors temperature catalysts and pressure It examines how temperature affects reaction rates distinguishes between homogeneous and heterogeneous catalysts and discusses the safety considerations of high pressure processes Real world examples and case studies illustrate these concepts The book culminates in reactor design and optimization integrating previously discussed principles to show how to design efficient chemical reactors The book s integrated approach emphasizes the interconnectedness of these variables providing a realistic understanding of reaction control Targeting a broad audience from students to industry professionals it offers valuable insights for improving chemical process efficiency by understanding the core variables that drive chemical reaction control
