

CHAPTERS 800 - 890 HIGHWAY DRAINAGE DESIGN CHAPTER 800 - GENERAL ASPECTS

Topic 801 - General

Index 801.1 - Introduction

This section is not a textbook, and is not a substitute for fundamental engineering knowledge or experience.

The fields of hydrology and the hydraulics of highway drainage are rapidly evolving and it is the responsibility of the engineer to keep abreast of current design practices. As new practices or procedures are adopted by the Department, this section will be updated.

Instructions for the design of highway drainage features provided are for information and guidance of Department employees. Drainage policies, procedures and standards given are subject to amendment as conditions warrant and are neither intended as, nor do they establish, legal standards. Special situations may call for variations from these requirements, subject to approval of the Division of Design or approval by others as may be specifically referenced.

801.2 Drainage Design Philosophy

Highway drainage design is much more than the mere application of the technical principles of hydrology and hydraulics. Good drainage design is a matter of properly balancing technical principles and data with the environment giving due consideration to other factors such as safety and economics. Such design can only be accomplished through the liberal use of sound engineering judgment. Drainage features to remove runoff from the roadway and to convey surface and stream waters originating upstream of the highway to the downstream side should be designed to accomplish these functions without causing objectionable backwater, excessive velocities, erosion or unduly affecting traffic safety. A goal in highway drainage design should be to perpetuate natural drainage, insofar as practical.

801.3 Drainage Standards

Drainage design criteria should be selected that are commensurate with the relative importance of the highway, associated risks, and possible damage to adjacent property. The objective of drainage design should be to provide optimum facilities considering function versus cost rather than to just meet minimum standards.

Engineers and other professional disciplines using this guide must recognize that hydrologic analysis, as practiced by the highway engineer, has not advanced to a level of precise mathematical expression. All hydrologic analysis methods, whether deterministic or statistical, are based on the information available. A common challenge faced by the highway design engineer is that there may be insufficient flow data or no data at all at the site for which a stream crossing is to be designed. By applying analytical principles and methods it is possible to obtain peak discharge estimates which are functionally acceptable for the design of highway drainage structures and other features.

The design of highway drainage structures and other features must consider the probability of flooding and provide protection which is commensurate with the importance of the highway, the potential for property damage, and traffic safety. Traditionally, the level of assurance for such protection has been specified in terms of the peak rate of flow during passage of a flood or storm of the severity associated with the frequency of occurrence, i.e. a 10-year storm, the 50-year flood, etc. State-of-the-art methods and procedures associated with the necessary hydrologic analysis required to determine the severity and probability of occurrence of possible rare storms and flood events are inherently ambiguous. Therefore, the suggested drainage design criteria relating to frequency of occurrence references in this manual are provided for guidance only and are not intended to establish either legal or design standards which must be strictly adhered to. Rather, they are intended as a starting point of reference for designing the most cost effective drainage structures and facilities considering the

Risk-Based Bridge Engineering Khaled Mahmoud, 2019-08-20 Risk based engineering is essential for the efficient asset management and safe operation of bridges. A risk based asset management strategy couples risk management standard work reliability based inspection and structural analysis and condition based maintenance to properly apply resources based on process criticality. This ensures that proper controls are put in place and reliability analysis is used to ensure continuous improvement. An effective risk based management system includes an enterprise asset management or resource solution that properly catalogues asset attribute data, a functional hierarchy, criticality analysis, risk and failure analysis, control plans, reliability analysis and continuous improvement. Such efforts include periodic inspections, condition evaluations and prioritizing repairs accordingly. This book contains select papers that were presented at the 10th New York City Bridge Conference held on August 26-27, 2019. The volume is a valuable contribution to the state of the art in bridge engineering.

Synthesis of Highway Practice National Cooperative Highway Research Program, 1974 Asphalt Paving Technology Association of Asphalt Paving Technologists, 1972 *Design Manual for Strengthening of Continuous-span Composite*

Bridges F. W. Klaiber, 1993 The need for upgrading a large number of understrength bridges in the United States has been well documented in the literature. This manual presents two methods for strengthening continuous span composite bridges: post-tensioning of the positive moment regions of the bridge stringers and the addition of superimposed trusses at the piers. The use of these two systems is an efficient method of reducing flexural overstresses in undercapacity bridges. Before strengthening a given bridge, however, other deficiencies (inadequate shear connection, fatigue problems, extensive corrosion)

should be addressed Since continuous span composite bridges are indeterminant structures there is longitudinal and transverse distribution of the strengthening axial forces and moments This manual basically provides the engineer with a procedure for determining the distribution of strengthening forces and moments throughout the bridge As a result of the longitudinal and transverse force distribution the design methodology presented in this manual for continuous span composite bridges is extremely complex To simplify the procedure a spreadsheet has been developed for use by practicing engineers This design aid greatly simplifies the design of a strengthening system for a given bridge in that it eliminates numerous tedious hand calculations computes the required force and moment fractions and performs the necessary iterations for determining the required strengthening forces The force and moment distribution fraction formulas developed in this manual are primarily for the Iowa DOT V12 and V14 three span four stringer bridges These formulas may be used on other bridges if they are within the limits stated in this manual Use of the distribution fraction formulas for bridges not within the stated limits is not recommended *Partial-lane Pavement Widening* National Research Council (U.S.).
