Student Exploration: Refraction

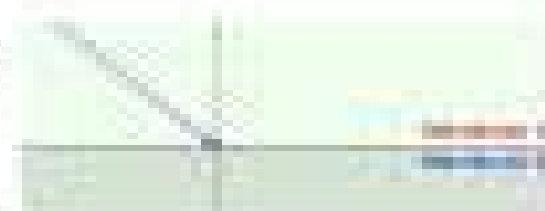

Learning Goals: Explain the relationship between the angle of incidence, frequency, and wavelength of light. Predict the direction of refraction for light passing from one medium to another.

Prerequisite Knowledge: Students should understand the concept of light as a wave and the relationship between frequency and wavelength.

- What would happen if light passed from one medium to another? (e.g., from air to water)?
- How does the speed of light change when it passes from one medium to another?
- What happens when light passes from one medium to another? (e.g., from air to water)?

Student Exploration

Light can travel through empty space, but it can also travel through a medium. The speed of light is fastest in a vacuum and slower in a medium. The speed of light in a medium is determined by the medium's refractive index. The refractive index is a measure of how much the speed of light is reduced when it travels through the medium.

Student Exploration Questions: What happens when light passes from one medium to another?

- What happens when light passes from a medium with a higher refractive index to a medium with a lower refractive index?
- What happens when light passes from a medium with a lower refractive index to a medium with a higher refractive index?
