*Cancer Cell Lines* John R. W. Masters, Bernhard Palsson, 2000. This book describes all human leukemia lymphoma cell lines that have been established and that grow continuously under standardised in vitro conditions. These lines are derived from cells belonging to all the major hematopoietic cell lineages i.e. B and T lymphocytes, natural killer cells, granulocytic cells and megakaryocytic cells. The clinical data, the culture conditions and the major phenotypic features of the cell lines are described with citations. This book is the first book describing human leukemia lymphoma cell lines and will be of interest to scientists involved in the areas of hematology, oncology, immunology, molecular biology and cytogenetics. *Cancer Cell Lines Volumes 1-3*. These 3 volumes provide a comprehensive text on the culture of established cell lines from every type of human cancer. The volumes provide a basic manual and reference resource for every cancer research scientist using human cancer cells.

*Cancer Cell Culture* Simon P. Langdon, 2008-02-01. The culture of cancer cells is routinely practiced in many academic research centers, biotechnology companies and hospital laboratories. *Cancer Cell Culture: Methods and Protocols* describes easy to follow methods to guide both novice and more experienced researchers seeking to use new techniques in their laboratories. Our present understanding of the cell and molecular biology of cancer has been derived mainly from the use of cultured cancer cells and we cover a number of the most widely used assays to study function in current use. Part I introduces the basic concept of cancer cell culture and this is followed by a description of the general techniques used in many cell culture facilities. The importance of cell line characterization is now widely recognized and methods to characterize and authenticate cell lines are described in Part II. Part III covers the isolation and development of specific cancer cell types and provides valuable tips for those wishing to derive new cell line models. A wide range of procedures encompassing many of the key functional features of cancer cells are described in Part IV, including assays to evaluate clonogenicity, cell proliferation, apoptosis, adhesion, migration, invasion, senescence, angiogenesis and cell cycle parameters. Methods to modify cancer cells are described in Part V, including protocols for transfection, development of drug resistance, immortalization and transfer in vivo. In Part VI, methods of coculture of different cell types and contamination of cell lines are covered. **Culture**
