Computational Chemistry: Reviews Of Current Trends, Vol. 5 Ermanno Gianinetti, Jozek S

Kwiatkowski, Jerzy Leszczynski, Piotr Piecuch, Jiri Sponer, Thanh N Truong, Charles A Weatherford, 2000-10-09 This volume comprises six chapters which explore the development and applications of the methods of computational chemistry The first chapter is on new developments in coupled cluster CC theory The homotopy method is used to obtain complete sets of solutions of nonlinear CC equations The correspondence between multiple solutions to the CCSD CCSDT and full CI equations is established and the applications of the new approach in modeling molecular systems are discussed The second chapter reviews the computational theory for the time dependent calculations of a solution to the Schrödinger equation for two electrons and focuses on the development of propagators to the solution The next chapter features a discussion on a new self consistent field for molecular interactions SCF MI scheme for modifying Roothaan equations in order to avoid basis set superposition errors BSSE This method is especially suitable for computations of intermolecular interactions Details of the theory along with examples of applications to nucleic acid base pair complexes are given This chapter is well complemented by the following chapter which reports the current status of computational studies of aromatic stacking and hydrogen bonding interactions among nucleic acid bases The next chapter reveals the possibility of calculating the kinetics of chemical reactions in biological systems from the first principles The last chapter reviews the results of rigorous ab initio studies of the series of derivatives of methane silane and germane The presented molecular and vibrational parameters complement experimental data for these systems In addition the theoretical approach allows the prediction of the effects of halogeno substitutions on their structures and properties
