Assume that a calorimeter is a closed system where all the energy released by an exothermic change is absorbed by the water in the calorimeter. If the mass of the water is known, the temperature change of the water can be used to determine the amount of heat energy released.

Equation for the calculation of heat is: $q = mC\Delta T$

q = heat released in Joules

m = mass of water in the calorimeter

C = specific heat capacity (**not $^{\circ}\text{C}$ which is a temperature**)

ΔT = [final temperature – initial temperature] (absolute value)

Key Questions:

1. What is the numerical value and units of the specific heat capacity of water?

Specific heat for water is $4.18 \frac{\text{J}}{\text{g}^{\circ}\text{C}}$ or $1 \frac{\text{cal}}{\text{g}^{\circ}\text{C}}$

2. What information does the specific heat capacity of water provide?

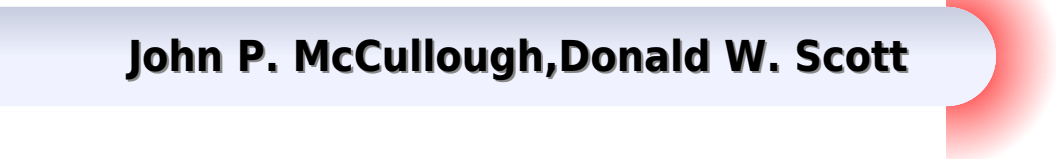

The specific heat value gives the amount of heat necessary to raise the temperature of one gram of water up 1°C .

3. How can the heat released into some mass of water be calculated from the specific heat capacity of water and the change in temperature of the water? Answer in words not with an equation.

Specific heat is how how much heat is needed to raise water 1°C , so if you how much the temperature changed, you can multiply the ΔT by specific heat to get the heat need to create temperature change.

Calorimetry of Non-Reacting Systems John P. McCullough, Donald W. Scott, 2013-10-22 Experimental Thermodynamics Volume 1 Calorimetry of Non Reacting Systems covers the heat capacity determinations for chemical substances in the solid liquid solution and vapor states at temperatures ranging from near the absolute zero to the highest at which calorimetry is feasible This book is divided into 14 chapters The first four chapters provide background information and general principles applicable to all types of calorimetry of non reacting systems The remaining 10 chapters deal with specific types of calorimetry Most of the types of calorimetry treated are developed over a considerable period and brought to a relatively sophisticated state For such calorimetry the approach adopted is to give detailed accounts of a few examples of apparatus and techniques representative of the best current practice in the field For the few types of calorimetry a general review of the field was considered more appropriate This book will prove useful to thermochemists engineers and experimentalists

Analytical Calorimetry Roger S. Porter, Julian F. Theory of Calorimetry W. Zielenkiewicz, E. Margas, 2006-01-02 Calorimetry is one of the oldest areas of physical chemistry The date on which calorimetry came into being may be taken as 13 June 1783 the day on which Lavoisier and Laplace presented a contribution entitled Memoire de la Chaleur at a session of the Academie Fran aise Throughout the existence of calorimetry many new methods have been developed and the measuring techniques have been improved At present numerous laboratories worldwide continue to focus attention on the development and applications of calorimetry and a number of companies specialize in the production of calorimeters The calorimeter is an instrument that allows heat effects in it to be determined by direct measurement of temperature Accordingly to determine a heat effect it is necessary to establish the relationship between the heat effect generated and the quantity measured in the calorimeter It is this relationship that unambiguously determines the mathematical model of the calorimeter Depending on the type of calorimeter applied the accuracy required and the conditions of heat and mass transfer that prevail in the device the relationship between the measured and generated quantities can assume different mathematical forms *Analytical Calorimetry* Roger S.

Combustion Calorimetry Stig Sunner, Margret Månsson, 2015-12-04 Combustion Calorimetry deals with expertise knowledge concerning the calorimetry of combustion reactions of an element or compound After defining the use of units and physical constants the book discusses the basic principles of combustion calorimetry and the various instruments and calorimeters used in the experiments to measure operations concerning temperatures and its time variations One paper discusses the theory and design criteria of combustion calorimeter calibration Another paper discusses the results obtained from a combustion calorimeter after it has measured the energy or enthalpy of combustion of an element or compound The

book then presents the need to define accurately the exact process in which a measured energy or enthalpy change is acknowledged One paper then presents how to find an assessment of uncertainty for any experimentally determined value through analysis of random errors and the propagation of errors Several papers discuss the combustion calorimetry of metals of organometallic compounds and of fluorine One paper presents the technological applications of heat reaction especially in the design of a chemical production plant where a reactor volume should desirably be least expensive The book then discusses the trends in combustion calorimetry such as the prevalence of a miniaturized bomb combustion calorimetry This volume will be beneficial to researches technicians and scientists in the field of catalysis biochemistry synthetic chemistry and medicine
