introduction to the physics of active matter and its application to questions in biology In recent decades the theory of active
matter has emerged as a powerful tool for exploring the differences between living and nonliving states of matter The
Restless Cell provides a self contained quantitative description of how the continuum theory of matter has been generalized
to account for the complex and sometimes counterintuitive behaviors of living materials Christina Hueschen and Rob Phillips
begin by illustrating how classical field theory has been used by physicists to describe the transport of matter by diffusion the
elastic deformations of solids and the flow of fluids Drawing on physical insights from the study of diffusion they introduce
readers to the continuum theory protocol a step by step framework for developing equations that describe matter as a
continuum and show how these methods and concepts can be generalized to the study of living energy consuming matter
Hueschen and Phillips then present a range of engaging biological case studies across scales such as the symmetry breaking
that occurs in developing embryos the perpetual flows that take place in giant algal cells and the herding of wildebeest on
the plains of the Serengeti An essential resource for students and researchers in biological physics and quantitative biology
The Restless Cell gives complete derivations of all calculations and features illustrations by Nigel Orme that seamlessly
bridge conceptual models and continuum descriptions of living matter
