

Using FFT in Cadence Spectre

First, you need to determine your input frequency based on the sampling rate and the number of samples to ensure **coherent sampling**. For example, the sampling rate is $f_s=100\text{MHz}$ and the number of samples (or number of FFT bins) is $N_{\text{FFT}}=2^6=64$. If we want the input frequency (f_{in}) is around 10MHz , the input frequency required for coherent sampling is given by:

- 1) Calculate $\frac{f_{\text{desire}}}{f_s} \times N_{\text{FFT}} = \frac{10}{100} \times 2^6 = 6.4$
- 2) Find the closest prime number to $\left\lfloor \frac{f_{\text{desire}}}{f_s} \times N_{\text{FFT}} \right\rfloor$, that is 7.
- 3) Then the actual input frequency is $\frac{7}{N_{\text{FFT}}} \times f_s = 10.9375\text{MHz}$

and the input bin is $f_{\text{bin}} = 7$.

In this example, the output of a residue amplifier needs to be analyzed. The RA generates $2X$ gain for a 1.5 bit pipeline stage.

First we set the input frequency to be $7/64 \times 100\text{MHz}$.

High Performance CMOS Range Imaging Andreas Süss, 2016-03-24 This work is dedicated to CMOS based imaging with the emphasis on the noise modeling characterization and optimization in order to contribute to the design of high performance imagers in general and range imagers in particular CMOS is known to be superior to CCD due to its flexibility in terms of integration capabilities but typically has to be enhanced to compete at parameters as for instance noise dynamic range or spectral response This work gathers the widespread theory on noise and extends the theory by a non rigorous but potentially computing efficient algorithm to estimate noise in time sampled systems

A Computer-Aided Design and Synthesis Environment for Analog Integrated Circuits Geert Van der Plas, Georges Gielen, Willy M.C. Analog Circuits and Systems Optimization based on Evolutionary Computation Techniques Manuel Barros, Jorge Guilherme, Nuno Horta, 2010-04-22 The microelectronics market with special emphasis to the production of complex mixed signal systems on chip SoC is driven by three main dynamics time market productivity and managing complexity Pushed by the progress in nanometer technology the design teams are facing a curve of complexity that grows exponentially thereby slowing down the productivity design rate Analog design automation tools are not developing at the same pace of technology once custom design characterized by decisions taken at each step of the analog design flow lies most of the time on designer knowledge and expertise Actually the use of sign management platforms like the Cadences Virtuoso platform with a set of tegrated CAD tools and database facilities to deal with the design transformations from the system level to the physical implementation can significantly speed up the design process and enhance the productivity of analog mixed signal integrated circuit IC design teams These design management platforms are a valuable help in analog IC design but they are still far behind the development stage of design automation tools already available for digital design Therefore the development of new CAD tools and design methodologies for analog and mixed signal ICs is ess tial to increase the designer s productivity and reduce design productivitygap The work presented in this book describes a new design automation approach to the problem of sizing analog ICs
