Calculated Risks How To Know When Numbers Deceive You:

Calculated Risks Gerd Gigerenzer, 2015-11-10 At the beginning of the twentieth century H G Wells predicted that statistical thinking would be as necessary for citizenship in a technological world as the ability to read and write But in the twenty first century we are often overwhelmed by a baffling array of percentages and probabilities as we try to navigate in a world dominated by statistics Cognitive scientist Gerd Gigerenzer says that because we haven't learned statistical thinking we don't understand risk and uncertainty In order to assess risk everything from the risk of an automobile accident to the certainty or uncertainty of some common medical screening tests we need a basic understanding of statistics Astonishingly doctors and lawyers don't understand risk any better than anyone else Gigerenzer reports a study in which doctors were told the results of breast cancer screenings and then were asked to explain the risks of contracting breast cancer to a woman who received a positive result from a screening The actual risk was small because the test gives many false positives But nearly every physician in the study overstated the risk Yet many people will have to make important health decisions based on such information and the interpretation of that information by their doctors Gigerenzer explains that a major obstacle to our understanding of numbers is that we live with an illusion of certainty Many of us believe that HIV tests DNA fingerprinting and the growing number of genetic tests are absolutely certain But even DNA evidence can produce spurious matches We cling to our illusion of certainty because the medical industry insurance companies investment advisers and election campaigns have become purveyors of certainty marketing it like a commodity To avoid confusion says Gigerenzer we should rely on more understandable representations of risk such as absolute risks For example it is said that a mammography screening reduces the risk of breast cancer by 25 percent But in absolute risks that means that out of every 1 000 women who do not participate in screening 4 will die while out of 1 000 women who do 3 will die A 25 percent risk reduction sounds much more significant than a benefit that 1 out of 1 000 women will reap This eye opening book explains how we can overcome our ignorance of numbers and better understand the risks we may be taking with our money our health and our lives

Heuristics and the Law Gerd Gigerenzer, Christoph Engel, 2006-08-11 Experts in law psychology and economics explore the power of fast and frugal heuristics in the creation and implementation of law In recent decades the economists concept of rational choice has dominated legal reasoning And yet in practical terms neither the lawbreakers the law addresses nor officers of the law behave as the hyperrational beings postulated by rational choice Critics of rational choice and believers in fast and frugal heuristics propose another approach using certain formulations or general principles heuristics to help navigate in an environment that is not a well ordered setting with an occasional disturbance as described in the language of rational choice but instead is fundamentally uncertain or characterized by an unmanageable degree of complexity This is the intuition behind behavioral law and economics In Heuristics and the Law experts in law
