

Structured Computer Organization

Fourth Edition

Andrew S. Tanenbaum

With contributions from James R. Goodman

Structured Computer Organization is the fourth edition of this best-selling introduction to computer hardware and architecture. It has been heavily revised to reflect the latest changes in the rapidly changing computer industry. Professor Tanenbaum has maintained his popular method of presenting the computer as a hierarchy of levels, each with a well-defined function. The book is written in a style and level of detail that covers all the major areas, but is still accessible to a broad range of readers.

After an introductory chapter and a chapter about system organization (processors, memories, and I/O devices), we come to the core of the book: chapters on the digital logic level, the microarchitecture level, the instruction set architecture level, the operating system level, and the assembly language level. Finally, there is a chapter on the increasingly important topic of parallel computer architectures.

New to this edition:

- The running examples throughout the book are now the Pentium II, Sun UltraSPARC II, and Java Virtual Machine, including Sun's hardware Java chip that implements JVM
- The input/output devices discussed in the **computer systems organization** chapter have been updated to emphasize modern technology such as RAID disks, CD-recordables, DVD, and color printers
- Modern computer buses, such as the PCI bus and USB bus have been added to the **digital logic level**.
- The microarchitecture level has been completely rewritten and updated as follows:
