Computational Methods for Microstructure-Property Relationships Somnath Ghosh, Dennis Dimiduk, 2010-11-17

Computational Methods for Microstructure Property Relationships introduces state of the art advances in computational modeling approaches for materials structure property relations Written with an approach that recognizes the necessity of the engineering computational mechanics framework this volume provides balanced treatment of heterogeneous materials structures within the microstructural and component scales Encompassing both computational mechanics and computational materials science disciplines this volume offers an analysis of the current techniques and selected topics important to industry researchers such as deformation creep and fatigue of primarily metallic materials Researchers engineers and professionals involved with predicting performance and failure of materials will find Computational Methods for Microstructure Property Relationships a valuable reference

Mechanics of Dislocation Fields Claude

Fressengeas, 2017-09-25 Accompanying the present trend of engineering systems aimed at size reduction and design at microscopic nanoscopic length scales Mechanics of Dislocation Fields describes the self organization of dislocation ensembles at small length scales and its consequences on the overall mechanical behavior of crystalline bodies The account of the fundamental interactions between the dislocations and other microscopic crystal defects is based on the use of smooth field quantities and powerful tools from the mathematical theory of partial differential equations The resulting theory is able to describe the emergence of dislocation microstructures and their evolution along complex loading paths Scale transitions are performed between the properties of the dislocation ensembles and the mechanical behavior of the body Several variants of this overall scheme are examined which focus on dislocation cores electromechanical interactions of dislocations with electric charges in dielectric materials the intermittency and scale invariance of dislocation activity grain to grain interactions in polycrystals size effects on mechanical behavior and path dependence of strain hardening

Microstructure-Property Optimization in Metallic Glasses Baran Sarac, 2015-03-12 This thesis consists of an in depth study of investigating microstructure property relationships in bulk metallic glasses using a novel quantitative approach by which influence of the second phase features on mechanical properties can be independently and systematically analyzed The author evaluates and optimizes the elastic and plastic deformation as well as the overall toughness of cellular honeycombs under in plane compression and porous heterostructures under uniaxial tension The study reveals three major deformation zones in cellular metallic glass structures where deformation changes from collective buckling showing non linear elasticity to localized failure exhibiting a brittle like deformation and finally to global sudden failure with negligible plasticity as the length to thickness ratio of the ligaments increases The author found that spacing and size of the pores the pore configuration within the matrix and the overall width of the sample determines the extent of deformation where the optimized values are attained for pore diameter to spacing ratio of one with AB type pore stacking
