wastes that contain emerging contaminants including waste recycling opportunities Nuclear Waste Management Facilities Advances Environmental Impacts and Future Prospects is a crucial tool needed to implement the safest and most environmentally considerate best practices within nuclear waste management facilities Presents recent approaches used to assess and improve the safety and reduce the environmental impacts of nuclear waste management facilities Offers technical guidance to support the development and defense of the environmental impact assessment EIA and Safety Cases to support the waste management facilities licensing throughout their lifecycles Highlights the future perspectives for wastes produced from innovative reactors and wastes containing emerging contaminants and recycling opportunities

Non-BF Slag-based Green Cementitious Materials Lijie Guo,Tingting Zhang,Xiaolu Guo,Weina Meng,2022-08-12 **Radionuclide and Metal Sorption on Cement and Concrete** Michael Ochs,Dirk Mallants,Lian Wang,2015-10-17 Cementitious materials are being widely used as solidification stabilisation and barrier materials for a variety of chemical and radioactive wastes primarily due to their favourable retention properties for metals radionuclides and other contaminants The retention properties result from various mineral phases in hydrated cement that possess a high density and diversity of reactive sites for the fixation of contaminants through a variety of sorption and incorporation reactions This book presents a state of the art review and critical evaluation of the type and magnitude of the various sorption and incorporation processes in hydrated cement systems for twenty five elements relevant for a broad range of radioactive and industrial wastes Effects of cement evolution or ageing on sorption incorporation processes are explicitly evaluated and quantified While the immobilisation of contaminants by mixing in during hydration is not explicitly addressed the underlying chemical processes are similar A quantitative database on the solid liquid distribution behaviour of radionuclides and other elements in hydrated cement systems is established on the basis of a consistent review and re evaluation of literature data In addition to recommended values all underlying original experimental data and key experimental information are provided which allows users to trace the given recommendations or to develop their own set of key values This database is closely tied to the safety analysis of near surface disposal of radioactive waste in Belgium It focuses on radioelements toxic stable elements and heavy metals which makes it relevant for investigations involving the interaction of radioactive and conventional contaminants with cement based barriers
