Chemotherapeutic Targets In Parasites Chemotherapeutic Targets In Parasites:

Chemotherapeutic Targets in Parasites Tag E. Mansour, 2002-11-04 Parasitic infections are the most prevalent of human diseases and researchers continue to face the challenge of designing drugs to successfully counteract them **Chemotherapeutic Targets in Parasites** analyzes the critical metabolic reactions and structural features essential for parasite survival and advocates the latest molecular strategies with which to identify effective antiparasitic agents An introduction to the early development of parasite chemotherapy is followed by an overview of biophysical techniques and genomic and proteomic analysis Several chapters are devoted to specific types of chemotherapeutic agents and their targets in malaria trypanosomes leishmania and amitochondrial protists Chapters on helminths include metabolic neuromuscular microtubular and tegumental targets Emphasized throughout is the design of more selective and less toxic drugs than in the past This book will be especially relevant to medical and clinical researchers and to graduate students in parasitology pharmacology medicine microbiology and biochemistry

Neuropeptide Systems as Targets for Parasite and Pest Control Timothy G. Geary, Aaron Maule, 2011-01-13 The need to continually discover new agents for the control or treatment of invertebrate pests and pathogens is undeniable Agriculture both animal and plant succeeds only to the extent that arthropod and helminth consumers vectors and pathogens can be kept at bay Humans and their companion animals are also plagued by invertebrate parasites The deployment of chemical agents for these purposes inevitably elicits the selection of resistant populations of the targets of control necessitating a regular introduction of new kinds of molecules Experience in other areas of chemotherapy has shown that a thorough understanding of the biology of disease is an essential platform upon which to build a discovery program Unfortunately investment of research resources into understanding the basic physiology of invertebrates as a strategy to illuminate new molecular targets for pesticide and parasiticide discovery has been scarce and the pace of introduction of new molecules for these indications has been slowed as a result An exciting and so far unexploited area to explore in this regard is invertebrate neuropeptide physiology This book was assembled to focus attention on this promising field by compiling a comprehensive review of recent research on neuropeptides in arthropods and helminths with contributions from many of the leading laboratories working on these systems

Drug Targets in Kinetoplastid Parasites Hemanta K. Majumder, 2008-09-15 If viewed globally the parasitic diseases pose an increasing

threat to human health and welfare The diseases caused by kinetoplastid protozoan parasites like Leishmania and Trypanosoma continue as a cause of suffering for many millions of people in both tropical and subtropical regions of the world Leishmania species are found throughout Latin America Africa and Asia Trypanosoma cruzi that cause Chagas disease is endemic in Latin America while members of Trypanosoma brucei group are found in sub Saharan Africa Although the past two decades has witnessed commendable research efforts and technical advances in our understanding of the biochemistry molecular and cell biology of these pathogens the dreaded protozoal diseases caused by these organisms threaten mankind Therapeutic tools for the treatment of most parasitic diseases are extremely limited The development of parasites resistant to many of the available drugs is also responsible for the depressing picture of disease persistence and death Development of commercially available vaccines is still far from reality though research and trial programs continue

Parasite Neuromusculature and Its Utility as a Drug Target Aaron G. Maule,T. A. Day,L. H. Chappell,2006-10-19 Nerve and muscle systems in helminth parasites interact in a highly co ordinated manner to control movements associated with alimentation reproduction locomotion and attachment All metazoan parasites rely on some or all of these activities for their survival For a long time it has been known that neuromuscular function in parasites is susceptible to chemotherapeutic attack and that compromising this aspect of parasite biology is sufficient to cure many parasite infections This volume outlines the latest research in this area showing why this system is so amenable to drug intervention and outlining potential targets for new treatments Written by experts in the field this volume will be invaluable to anyone interested in the molecular biology physiology and biochemistry of parasites as well as those looking to exploit these for the creation of new treatments

Apicomplexan Parasites Katja Becker,2011-01-19 This handbook is the first dealing with the discovery of drugs directed against apicomplexan parasites Amongst others this group of endoparasites includes the causative agents of Malaria Toxoplasmosis and Babesiosis the latter occurring mainly in animals Written by renowned scientific experts from academia and industry the book focuses on current drug development approaches for all apicomplexan diseases making it appealing to a large audience ranging from research labs in academia to the human and veterinarian pharmaceutical industry This work is the second volume of the new book series Drug Discovery in Infectious Diseases edited by Prof Dr Paul M Selzer

Host-Parasite Cellular and Molecular Interactions in Protozoal Infections K.-P. Chang,David Snary,2013-06-29 Tropical diseases such as leishmaniasis malaria trypanosomiasis toxoplasmosis and amebiasis continue to plague the world resulting in considerable morbidity and mortality especially in the third world countries These diseases are caused by a group of protozoa which have over the years undergone evolutionary adaptation to live often intracellularly in a parasitic way of life So well adapted have they become that they recognize the right hosts or cells to parasitize yet at the same time they escape recognition and destruction by the host immune system The mechanisms of such recognition and the escape of recognition are governed largely by host parasite surface membrane interactions at the cellular and molecular level Unique molecules

produced by unusual pathways of these parasites have also been discovered and found to play important roles in their survival in the host. Understanding these mechanisms and pathways is essential not only to formulate a rational strategy for chemo and immuno prophylaxis and therapy but also to unravel the mystery of biological evolution in symbiosis and parasitism. In the advent of our knowledge on the molecular biology and biochemistry of parasite membrane and other molecules it is opportune to examine and discuss their possible roles in host parasite recognition and interaction in a comparative approach. To highlight the recent advances of this area in various host parasite systems a NATO advanced Research Workshop was held from September 27 to October 1 1986 at Hotel Villa del Mare Acquafredda di Maratea Italy.

Christian Doerig, Gerald Spaeth, Martin Wiese, 2013-10-11 This is the first book to collect and summarize in one publication the efforts to use kinases or phosphatases for drug development against parasite infections The editors and contributors comprise the Who is Who in the field and they are comprehensive in covering every aspect of the topic from basic research findings to translational approaches in drug development The result will be welcomed by everyone in academia and industry participating in the global effort to finally combat the major diseases caused by eukaryotic parasites This is volume one of a two volume treatise the second being exclusively dedicated to efforts to combat malaria using the same approach
